Introduction and Data Overview

The Issue: The ongoing housing crisis in the United States

While the U.S. real estate market has seen its share of fluctuations throughout history, one issue has become particularly pressing in the past decade: the housing crisis. Several factors have contributed to the escalation of this problem, including rapid population growth, considering that the current U.S. population is 340.1 million people, urban migration, and a shortage of affordable housing options (U.S. Census Bureau, n.d.). As a result, there is a widespread shortage of homes, especially in densely populated metropolitan areas such as New York City, Los Angeles, Philadelphia, and Boston, driving housing prices to unsustainable levels.

The Data: This study will compile quantitative data from a variety of credible and authoritative sources and databases to deliver four key data sets. These data sets help to illustrate the disparity between housing supply, demand, and affordability, all of which are central to the crisis.

The first graph tracks housing units constructed in the U.S., focusing on attained permits for construction and the amount of those completed and broken down by region. The second graph examines the median U.S. listing prices of homes over time, showing significant increases in housing costs in U.S. dollars. Similarly, the third data set explores median household income in the U.S. over time in U.S. dollars, comparing it to the rise in housing prices. By analyzing historical income trends, whether or not wage growth has kept up with the escalating cost of homeownership can be assessed. Finally, the fourth graph analyzes the number of baby boomers who own homes but are not selling or moving out, broken down by age ranges and change per capita of homeownership cohorts. Together, these four data sets provide a comprehensive picture of the housing crisis, illustrating the imbalance between supply, demand, and affordability in the U.S. housing market.

Data Dictionary

Field Name	Data Type	Description	Field Example
median_listing_price	Integer	The median price of homes listed for sale in the U.S. in nominal dollars. This includes monthly data from 2016 to 2025 and shows the trend of home prices.	424,900 USD
united_states_housing_unit_estimate	Integer	The total number of housing units in the U.S., including both new and existing homes, from 2010 to 2023. This field is useful for understanding the overall housing supply.	140,000,000 units
median_household_income_estimate _all_races	Integer	The median income of all U.S. households from 1967 to 2023 from all races combined. This variable helps assess the affordability of housing relative to income.	68,700 USD
median_listing _price_yy	Percentage	Represents the year to year percentage change in median listing price of homes using weekly metrics. Positive values indicate an increase in listing prices, while a negative one suggests a decrease.	-0.20%

Purpose

The purpose of calling attention to the current housing crisis is to address the issues our ancestors have created so that there will be hope of not repeating this man-made issue. Our ancestors mass produced between the years 1946 and 1964, also known as the Baby Boomer Generation. The population increased by a total of fifty-four million individuals, and the generation after them, Generation X and the Millennials, increased the population by seventy million individuals. The increasingly growing population has led to a decrease in land available to build housing. Eventually, there will not be enough available land for housing and houses will be built very close to one another. Every suburb will become an urban development of housing.

Not only is the population a key factor in the housing crisis, but so is underbuilding. Underbuilding is the failure to construct enough housing units to meet demand. This key factor has led to housing shortages, rising prices, and reduced affordability for new buyers and renters especially. The current housing shortage in the United States is between four and seven million homes. In the past three years, the average monthly rental cost has increased by eighteen percent, and the average purchase price of housing has increased by twenty-one percent.

Rising costs are another key factor in the current housing crisis due to the lack of adequate housing supply and the nationwide shortage of housing properties. Fewer aging couples are moving into smaller housing units, and the majority of the couples in their reproductive years are living in small apartment units. The older couples are not moving into smaller housing units due to relatively high interest rates and inflation. The younger couples are growing their families and having to stay in small living units or looking to build properties on land that could be used for farming or other benefits. Even though the younger generation is looking to build housing on available land, there has been an increase in material costs, lengthy permitting processes, restrictive zoning regulations, and a decrease in the construction workforce.

Methods

We collected our data through extensive online research from a range of reliable sources and databases. While the process was time-consuming, it enabled us to compile a thorough set of information that has guided our analysis, insights, and conclusions. We made efforts to verify the accuracy of the data whenever possible, and we are confident in the quality of the information we've gathered. As a result, we are confident that our perspective on the subject is both well-informed and rigorously developed.

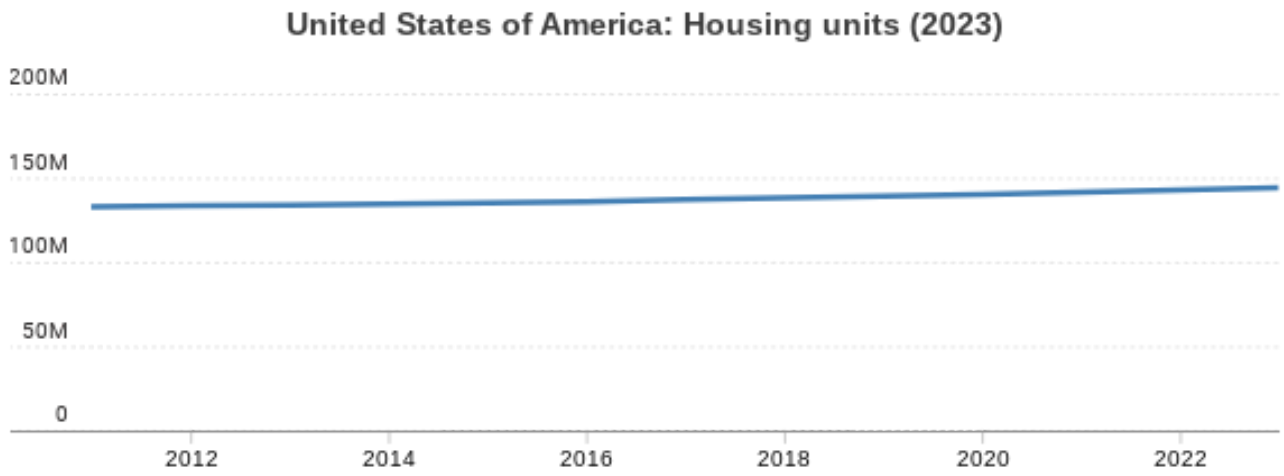
Data sets were acquired from the following sources:

1. American Community Service, U.S. Census Bureau
2. Federal Reserve Economic Data
3. Realtor.com Economic Research

Full Works Cited can be found on pages 15 through 17.

Results

I. Establishing the issue:

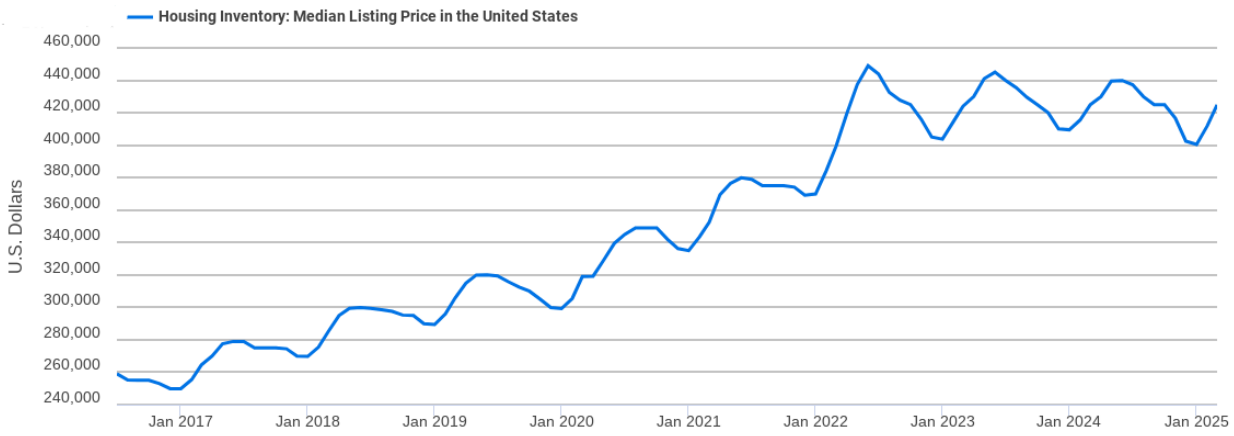


Data Source: American Community Survey, U.S. Census Bureau (See Appendix Datasheets 1 and 2)

The American Community Survey (ACS) is conducted by the U.S. Census Bureau, a trusted and authoritative source of demographic and economic data in the United States. Established in 2005, the ACS is a nationwide survey that collects detailed information on a variety of topics, including housing, income, and population demographics, on an annual basis. The U.S. Census Bureau, established in 1903, is known for its rigorous data collection methods and high standards for accuracy, making its data one of the most reliable sources for understanding trends in the American housing market. With over 100 years of experience, the Census Bureau plays a crucial role in shaping public policy, research, and economic decision-making, by providing credible and relevant data about the U.S.

As depicted in the graph, housing units within the U.S. have grown linearly, by 10.26% from 2010 to 2023. During that same period, the U.S. population has grown by 9.96%, going from 309.3 million in 2010 to 340.1 million in 2024. Although the increase in housing units is slightly greater than the population growth, population growth is closely following the housing units made figure, raising some concern. Additionally, the overall supply of housing units has not kept pace with the increasing demand for housing in general. This imbalance suggests that the available housing units may not be sufficient to meet the needs of a growing and increasingly urbanized population. Other factors, such as inflation in home prices, stagnation in wage growth, and demographic trends like baby boomers holding on to their homes, further exacerbate the housing shortage and contribute to underbuilding, making it harder for many individuals to find affordable housing.

II. Rising Median Listing Prices

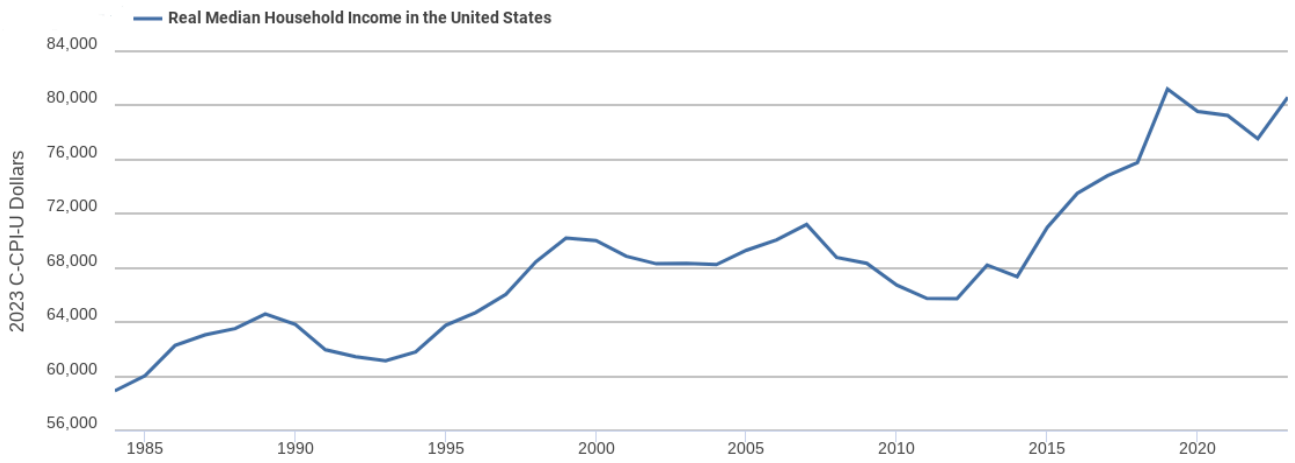


Data Source: Realtor.com Economic Research (See Appendix Datasheets 4 and 5)

To analyze trends in median listing prices over time as a contributor to the existing housing crisis, we used retrieved data from Realtor.com's Economic Research division. Established in 1996, Realtor.com is a widely recognized and reputable real estate marketplace that provides data-driven insights through its Economic Research division. Backed by expert economists and analysts, the site offers comprehensive real estate statistics, forecasts, analysis, and commentary on proprietary data that is used by policymakers, media outlets, and researchers. Its reports provide up-to-date listings and transactions, making it a reliable source for understanding U.S. housing market dynamics.

In our research within this site, we extracted data on median listing prices within the U.S. from 2016 to 2024. As shown in the graph, from January 2016 to January 2025, the median listing price of homes has surged from $260,000 to $420,000, which is a 62% increase. In comparison, the average annual inflation rate during this period has been around 2.8% in 2017 and 2.9% in 2024, which translates to a much slower increase in the general cost of goods and services (*Current US Inflation Rates: 2000-2025*, n.d.). Thus, even after adjusting for inflation, the increase in housing prices far exceeds the rate of inflation, highlighting the rapid and disproportionate rise in home prices. This disparity underscores a key factor in the housing crisis: while everyday expenses have grown at a steady pace, housing costs have become astronomically unaffordable, making housing prices a driving force behind the current U.S. housing crisis.

III. Insufficient Median Household Income Growth



Data Source: Federal Reserve Economic Data (See Appendix Datasheet 3)

Moreover, we found the median household income growth to be disproportionate to rising median listing prices for homes. To conclude, we extracted and visually mapped datasets from the Federal Reserve Economic Research. Established in 1913 as the central banking system of the United States, the Federal Reserve is a highly trusted authority in economic research and data collection. Its economic data is rigorously analyzed and provides valuable insights into monetary policy, inflation, employment, and economic growth.

So, not only have limited housing units and rising median listing prices contributed to the current housing crisis, but so have median household incomes. Over the past several decades, U.S. median household income has grown, but not at the same pace as housing prices. According to our data illustrated in the above graph, in 1967, the median household income was around $53,530, rising to $80,160 by 2023, which is a 49.75% increase. While this growth is notable, it falls short when compared to the 62% rise in median listing prices from 2016 to 2025, which surged from $260,000 to $420,000. This widening gap between income growth and housing costs directly impacts the Housing Affordability Index (HAI), a key measure of how well a typical family can afford a mortgage on a median-priced home. The HAI incorporates median household income, mortgage rates, and home prices. An HAI above 100 indicates that homes are affordable, while a value below 100 signals that homes are becoming increasingly out of reach. In 2016, the HAI stood at 134.3, meaning median household income was sufficient to afford a median-priced home. However, by 2024, the HAI dropped to 98.1, reflecting the growing mismatch between income and home prices. This limited growth in median household income, alongside rising home prices, plays a crucial role in the housing crisis, making homeownership increasingly unattainable for many Americans. Thus, as housing prices continue to rise faster than wages, fewer people are able to afford homes, deepening the housing affordability problem in the U.S.

IV. Unwavering Baby Boomer Homeownership Rates

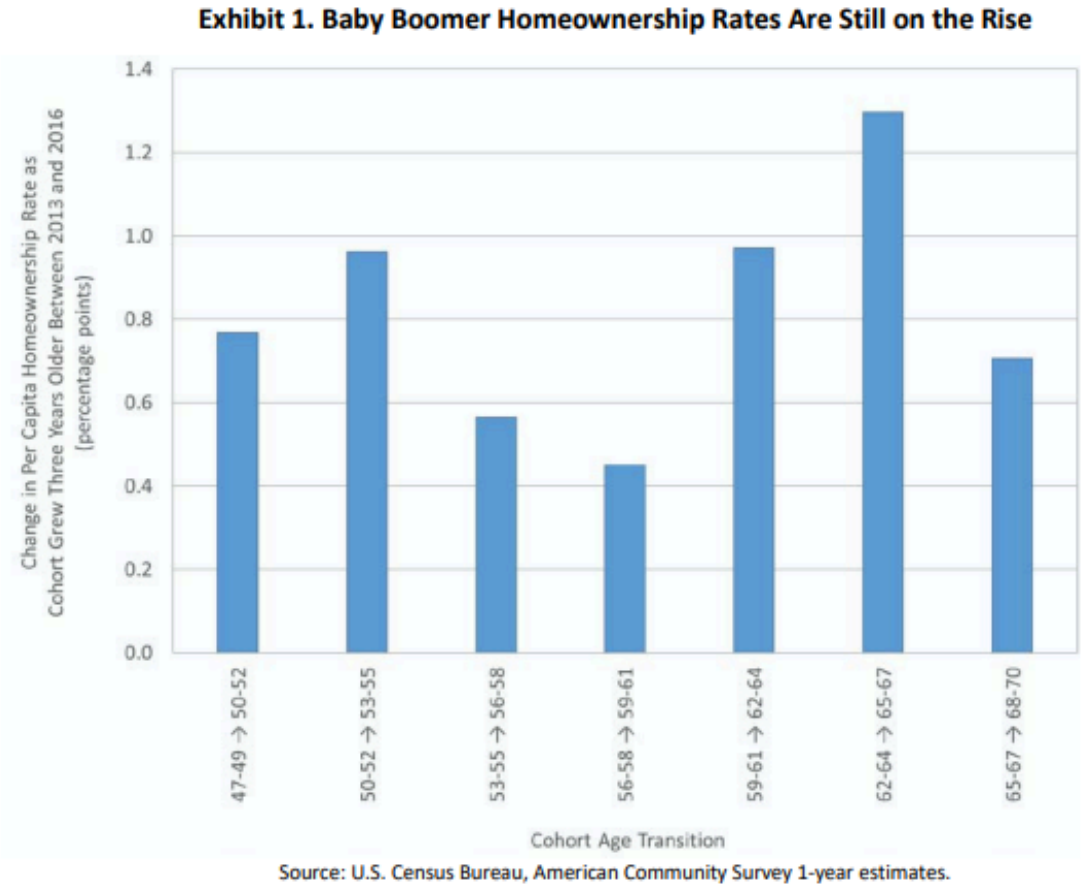


Chart Source: Myers & Simmons, 2024 (See Works Cited)

In addition, during our research, we came upon an article titled *Housing Insights: The Coming Exodus of Older Homeowners,* authored by Dowell Myers and Patrick Simmons, where they present research on the impact of boomer homeowners on the housing market. Both authors within this article are highly respected experts in their fields. Myers is a Professor of Policy, Planning, and Demography at the University of Southern California, specializing in housing demography, immigration, and aging trends in urban areas while Simmons, as Director of Strategic Planning at Fannie Mae's Economic & Strategic Research Group, focuses on the impact of demographic trends on the housing and mortgage markets. Their combined expertise makes their work credible and invaluable, of to which we utilized a graph they created.

Per the graph and our research, we found that boomer homeownership patterns have played a significant role in shaping the current housing landscape. According to the graph, which shows the change in per capita homeownership as cohorts aged from 2013 to 2016, one of the most notable transitions occurred between the 56-58 and 59-61 age cohorts, since it has the lowest change in homeownership, having a 0.4% change, suggesting that they've remained consistent in

owning their homes. This poses a problem, since with aging boomers, a larger proportion of them are remaining in or acquiring homes, which contributes to the overall tightening of the housing market. The reluctance or inability of many boomers to downsize or sell their homes further limits housing availability for younger buyers, exacerbating the housing crisis.

Conclusion

The current housing crisis is due to an increasingly high population, underbuilding, and rising costs of supplies. The high population initially grew at an alarming number during the Baby Boomers generation and the population kept increasing from there. Underbuilding is the failure to construct enough housing units to meet demand. This key factor has led to housing shortages, rising prices, and reduced affordability for new buyers and renters especially. The current housing shortage in the United States is between four and seven million homes. In the past three years, the average monthly rental cost has increased by eighteen percent, and the average purchase price of housing has increased by twenty-one percent. Rising costs are due to the lack of adequate housing supply and the nationwide shortage of housing properties. Majority buildings are torn down to make room for new buildings instead of repurposing existing buildings. Leading to young families to build their own houses on available lands, but there has been an increase in material costs, lengthy permitting processes, restrictive zoning regulations, and a decrease in the construction workforce.

The generation of Baby Boomers has consistently affected the increase in population. After reviewing multiple graphs, it has been revealed that the U.S. population has increased by 9.96% from 2010 to 2024. To show in a different perspective, the population in 2010 was 309.3 million and the population in 2024 was 340.1 million. During the same period, housing units within the U.S. have also increased, by 10.26% from 2010 to 2023. Compared to this increase in population and housing units, the increase in housing units is slightly greater than the population increase. The population growth is closely following the number of housing units being built, which has become concerning. The overall supply of housing is another concern because the supply has not kept up with the demand for housing. This suggests that there may not be enough housing units to meet the needs of the growing population in the future.

Also, the median listing prices in the U.S. from 2016 to 2025 has risen by 62%, or in other terms, $26,000 to $42,000. Even after adjusting for inflation, the increase in housing prices far exceeds the rate of inflation, highlighting the rapid and disproportionate rise in home prices. Median household income has also become a key factor contributing to the housing crisis because it has increased over several decades, but can not keep up with the prices of house listings. The median household income has increased by 49.75% and the housing prices have increased by 62% from 2016 to 2025. Homeownership amongst Baby Boomers are contributing to the current housing crisis. Between the ages of fifty-six to sixty-one, Baby Boomers, are the lowest change in homeownership, a 0.4% change, from 2013 to 2016.

Solutions that can decrease the demand for new available housing and eventually calm the housing crisis are repurposing existing buildings, expanding the housing supply, and unlocking existing housing inventory. The existing housing inventory would include streamlining the home buying process, lowering down payment requirements, and offering

financial assistance to first-time homebuyers. To streamline the home buying process the loan application needs to be simplified and more resources to help first-time home buyers need to be provided in more communities. To lower down payment requirements more government programs need to be explored, such as leverage FHA loans, that allow down payments as low as 3.5%. Veterans and active-duty military individuals also receive 0% down payment options. Individuals living in rural areas can also benefit from 0% down payment options, known as a USDA loan. There are many loans in Delaware that are beneficial to new homeowners; such as, Delaware Diamonds Home Loan, First State Home Loan, Smart Start Home Loan, and Home Sweet Home Loan.

Next Steps

Repurposing existing buildings uses abandoned sites and re-develops them into useful areas, such as housing. Repurposing existing buildings is less costly since a new structure does not need to be built, only improvements to the original structure. Adaptive reusable projects cost sixteen percent less and are completed in eighteen percent less time than compared to typical construction projects. There are excellent examples of repurposed existing buildings around the nation, including: The Highland Mall in Austin, Texas; Ponce City Market in Atlanta, Georgia; The Old Chicago Main Post Office in Chicago, Illinois; and Atlanta's Historic Pullman Yard in Kirkyard in Atlanta, Georgia. The Highland Mall in Austin, Texas was redeveloped from a shopping mall into a eighty-one acre area furnished with offices, retail, affordable housing, single-family housing, one point twenty-five miles of trails, and three new parks.

Expanding the housing supply would include expanding capital for affordable housing development, which is a part of the Affordable Housing Credit Improvement Act and the Neighborhood Homes Investment Act. The proposals mentioned would expand the supply of affordable rental housing. Expanding the access to the capital needed would build new affordable housing, including rental and for-ownership homes, and preserve existing properties. If we improve the access to financial tools, such as including capital for emerging developers providing small and medium multifamily housing and single-family housing that can provide home-ownership for low and middle income families.

To unlock existing housing inventory we need to streamline the home buying process, lower down payment requirements, and offer financial assistance to first-time homebuyers. To streamline the home buying process the loan application needs to be simplified and more resources to help first-time home buyers need to be provided in more communities. To lower down payment requirements more government programs need to be explored, such as leverage FHA loans, that allow down payments as low as 3.5%. Veterans and active-duty military individuals also receive 0% down payment options. Individuals living in rural areas can also benefit from 0% down payment options, known as a USDA loan. There are many loans in Delaware that are beneficial to new homeowners; such as, Delaware Diamonds Home Loan, First State Home Loan, Smart Start Home Loan, and Home Sweet Home Loan.

Introduction

While the U.S. real estate market has seen its share of fluctuations throughout history, one issue has become particularly pressing in the past decade: the housing crisis. Several factors have contributed to the escalation of this problem, including rapid population growth, considering that the current U.S. population is 340.1 million people, urban migration, and a shortage of affordable housing options (U.S. Census Bureau, n.d.). As a result, there is a widespread shortage of homes, especially in densely populated metropolitan areas such as New York City, Los Angeles, Philadelphia, and Boston, driving housing prices to unsustainable levels.

Purpose

The purpose of studying the housing crisis is to call attention and to learn from the history of our ancestors. Our ancestors increased the population drastically, which kept the population continually increasing. This has led to a decrease in the amount of land available for building housing. There has also been a high amount of underbuilding, which is the failure to construct enough housing units to meet demand. This is also a key factor in the current housing shortage. Rising costs have played a factor because of high demand and low housing supply.

Methods

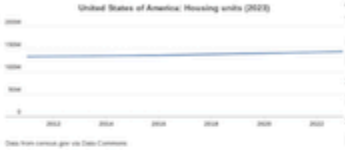
We collected our data through extensive online research from a range of reliable sources and databases.

Results

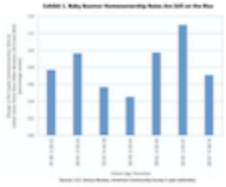
1. Establishing the issue: As depicted in the graph, housing units within the U.S. have grown linearly, by 10.26% from 2010 to 2023. During that same period, the U.S. population has grown by 9.96%, going from 309.3 million in 2010 to 340.1 million in 2024. Although the increase in housing units is slightly greater than the population growth, population growth is closely following the housing units made figure, raising some concern. Additionally, the overall supply of housing units has not kept pace with the increasing demand for housing in general. This imbalance suggests that the available housing units may not be sufficient to meet the needs of a growing and increasingly urbanized population.

3. Insufficient Median Household Income Growth: Not only is there limited housing units and rising median listing prices that has contributed to the housing crisis, but also median household incomes. The median household income has increased over the past several decades, but not at the same rate as housing prices. There was a 49.75% increase in medican household incomes in the U.S., but housing prices have had an increase of 62% from 2016 to 2025.

Results



2. Rising Median Listing Prices: The graph shows median listing prices in the U.S. from 2016 to 2025. From January 2016 to Januraay 2025, the median listing price of homes has surged from $260,000 to $42,000, which is a 62% increase. Even after adjusting for inflation, the increase in housing prices far eceeds the rate of inflation, highlighting the rapid and disproportionate rise in home prices.



4. Unwavering Baby Boomer Homeownership Rates: The graph shows the change in per capita homeownership as cohorts aged from 2013 to 2016. The most notable transition occurred between the ages of 56-58 and 59-61, since it was the lowest change in homeownership (0.4% change).

Conclusion

After reviewing a significant amount of data, the current population, underbuilding, and rising costs are key factors that have implemented the current housing crisis. The solutions we found are repurposing existing housing properties, expanding the housing supply, and unlocking existing housing inventory. To unlock existing housing inventory we would need to streamline the home buying process, lower down payment requirements, and offer finacial assistance to first-time homebuyers.

Next Steps (TPACK)

Repurposing existing buildings uses abandoned sites and re-develops them into useful areas, such as housing. This solution is less costly since a new structure does not need to be built, only improvements to the original structure. Another solution is to streamline the home buying process, lower down payment requirements, and offer finacial assiatance to first-time homebuyers.
