AIR POLLUTION IN NEW YORK CITY

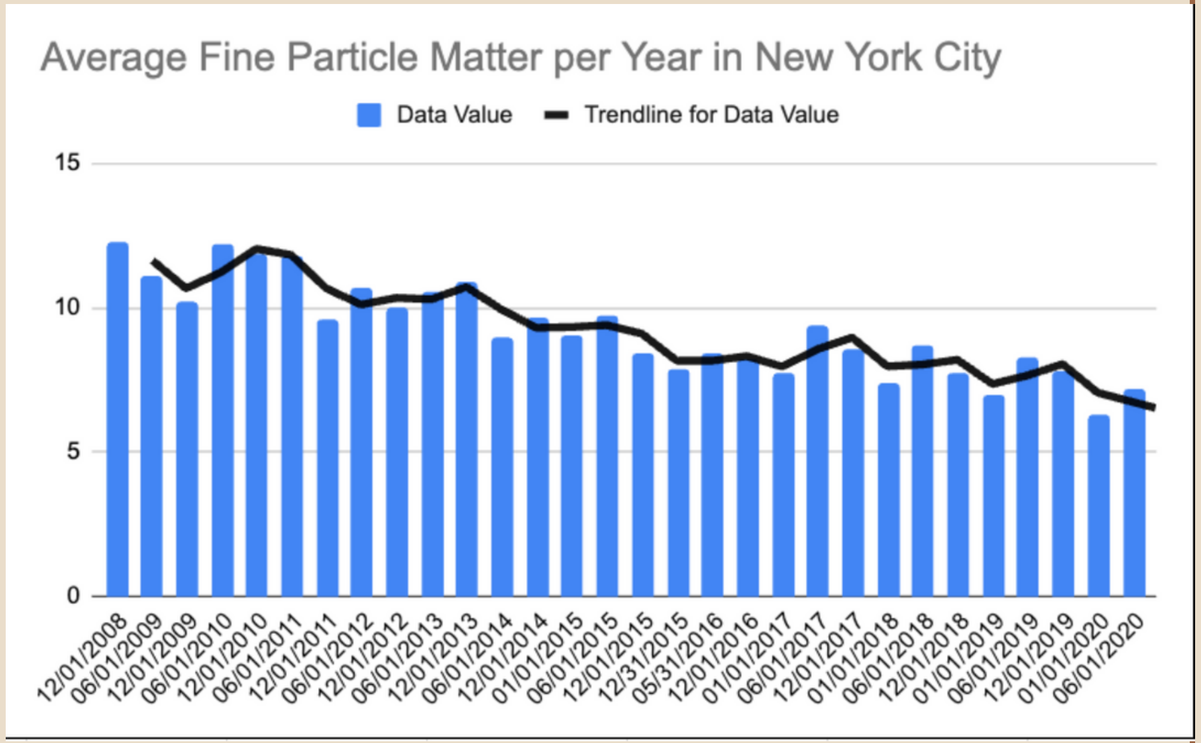
21088-2

INTRODUCTION

New York City (NYC) is a city that is known for there awful air polution. In this Document we will find a soltion for this problem along with where the polution is coming from.

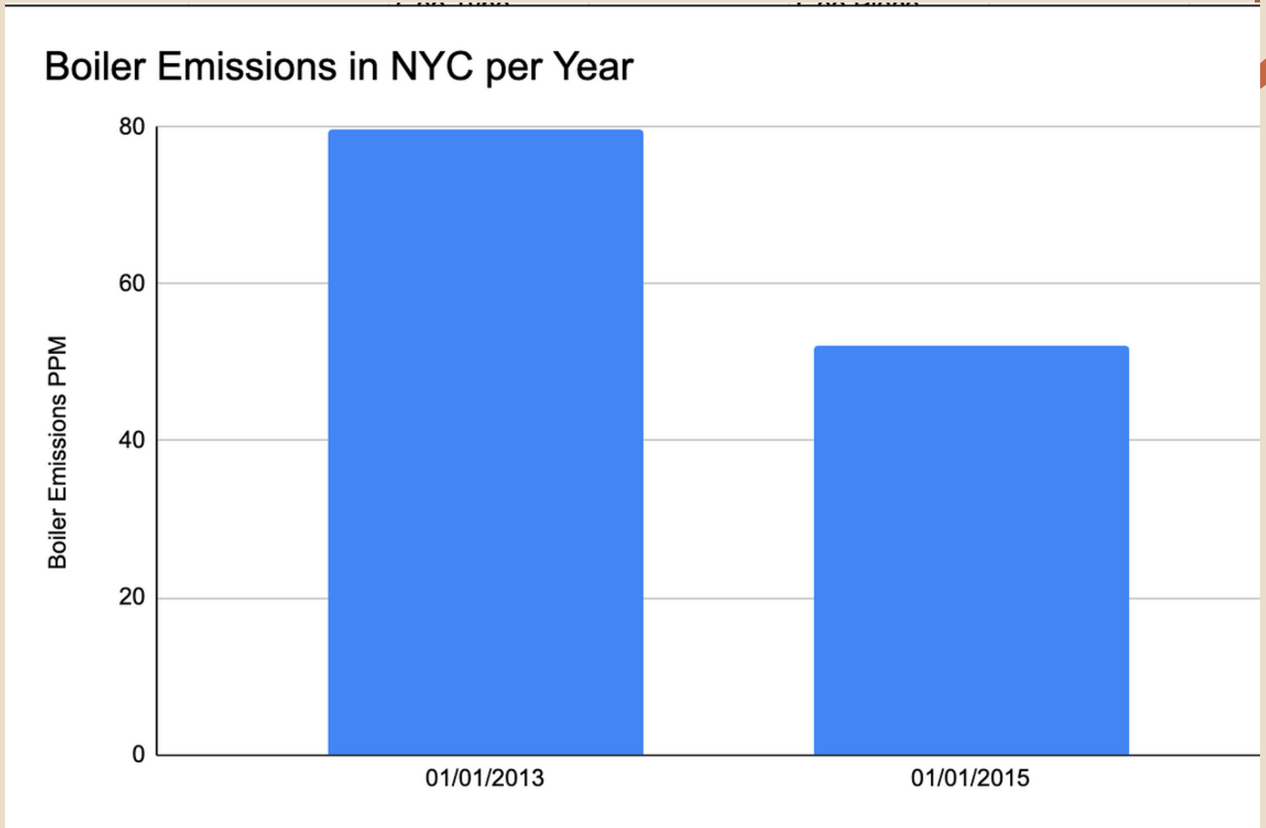
PPM IN NYC

As you can see in the graph to the right the average Fine particle matter per year in NYC is at a consistant downward trend.



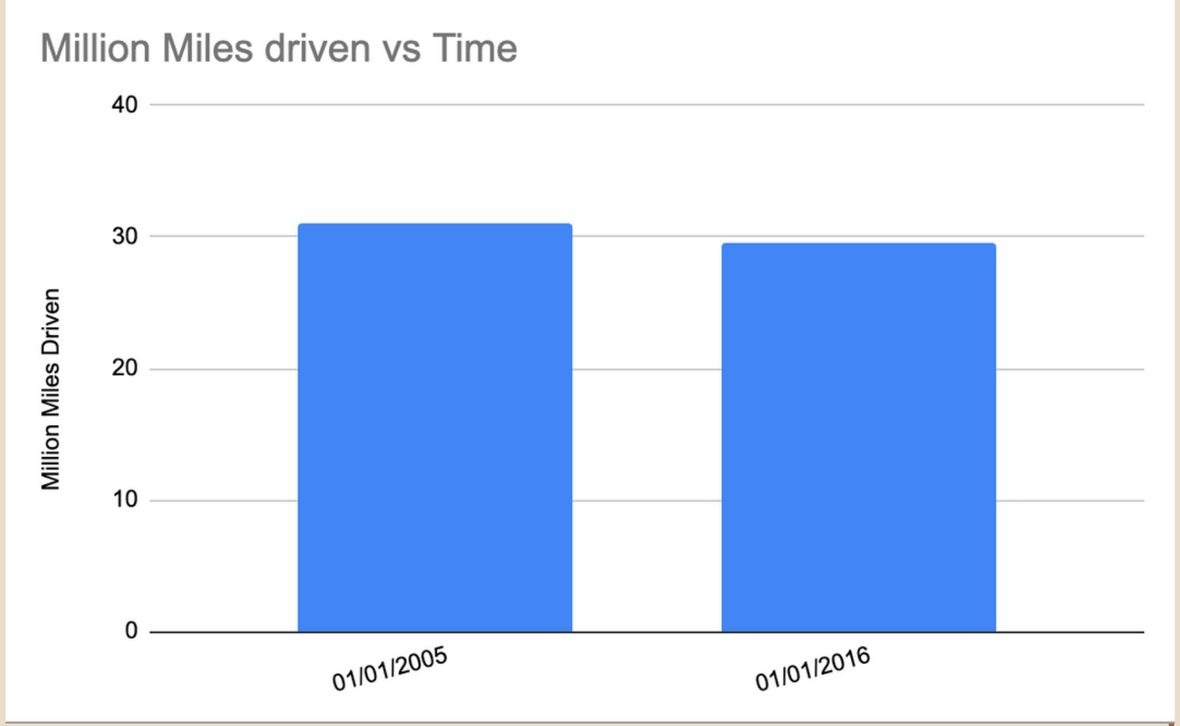
BOILER EMISSONS

As you can see in the graph boiler emissions has had a major decrease between 2013 and 2015.



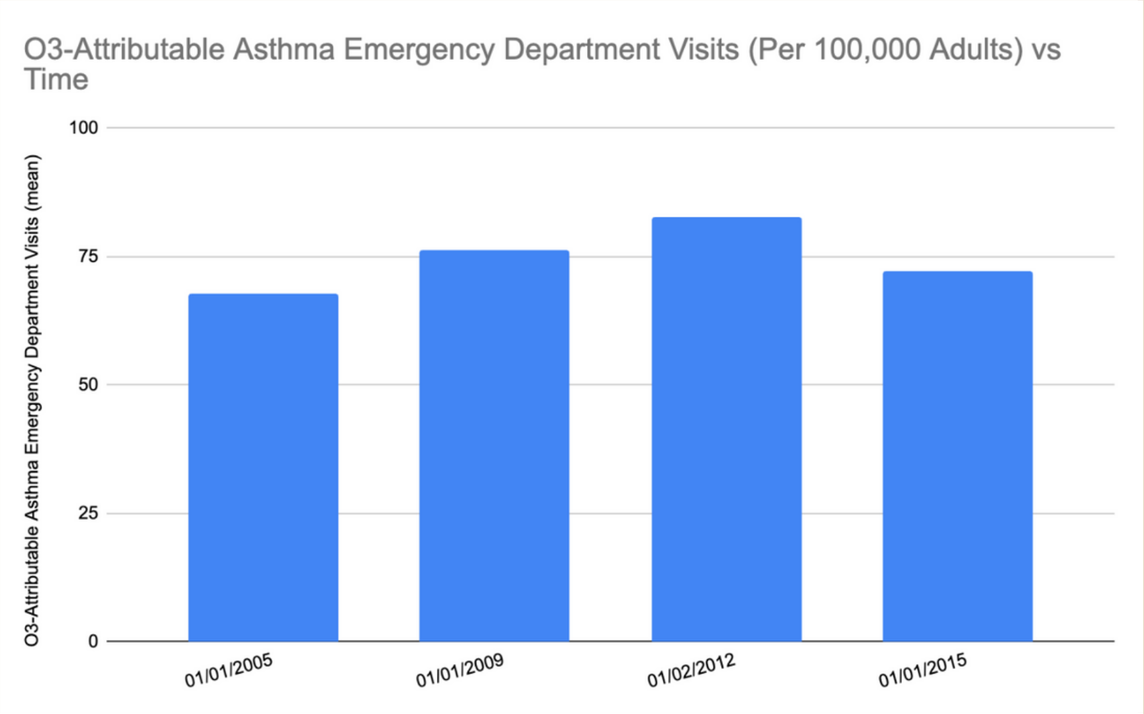
MILES DRIVEN

We can see in this graph to the left that the amount of miles driven by vehicles in NYC has decreased from 2005 to 2016 by a slight amount but still decreased.



ASMA HOSPITILIZATION

We can see in this graph to the left that the amount of hospitalizations of those who have anstha have decreased in NYC from its peak in 2012 to 2015.



CONCLUSION

From the data provided we have found that NYC's air pollution is declining. We believe this is due to boiler emissions, PM 2.5, and the amount of miles driven decreasing. This has caused the amount of hospital visits and the amount of hospitalizations have decreased for those who have asthma in NYC.

THANK YOU SO MUCH
